Mr. Brad Stimple
On-Scene Coordinator
U.S. EPA Region 5 – Cleveland Office
25089 Center Ridge Road
Westlake, OH 44145

Dear Mr. Stimple:

Re: Final Proposed Modification to the Ambient Air Quality Monitoring Plan
GM Powertrain Bedford Facility, Bedford, IN (Site)

This letter proposes modifications to the Ambient Air Quality Monitoring Plan (AAQMP) (CRA, 2003) based on favorable air monitoring results obtained to date at the Site. The AAQMP was prepared by Conestoga-Rovers & Associates, Inc. (CRA), on behalf of General Motors Corporation (GM), for Removal Action (RA) activities being completed for designated portions of Pleasant Run Watershed located in Bedford, Indiana. The AAQMP supports work defined in the United States Environmental Protection Agency (U.S. EPA) approved Upstream Parcel Removal Action Work Plan (CRA, 2003), Parcel 22 Removal Action Work Plan (CRA, 2003), and Downstream Parcel Removal Action Work Plan (CRA, 2004). The objective of the AAQMP was to quantify the airborne concentrations of contaminants, if any, at the locations of the nearest potential receptors that may be associated with the implementation of Work Plan activities such that work practices could be modified if issues had been identified. The existing air sampling program, results, and the basis for the proposed modifications to the air-sampling program are described below.

1.0 EXISTING AIR MONITORING PROGRAM

The Work Plans for the Removal Action address the potential for the emission of polychlorinated biphenyls (PCBs) and total suspended particulates (TSPs) during soil excavation and material handling activities at the Site. In order to verify that no unacceptable emissions occur, air monitoring is conducted daily around the Site perimeter during excavation activities at locations between excavation areas and the closest potential receptors.

According to the AAQMP, PCB and TSP monitoring is performed around the active work areas on a 24-hour basis. The air-monitoring program yields average concentrations in the ambient air for the selected compounds over each 24-hour period. Concentrations of PCBs and TSPs are determined by measuring the amount of contaminant collected onto absorbent media, or filters,

over the 24-hour period and measuring the volume of air collected over a 24-hour period. Meteorological readings (i.e. temperature, humidity, and barometric pressure) are recorded daily from nearby weather stations to correct and reduce (for reporting) the measured data to ambient conditions.

PCB and TSP samples are obtained from four sampling locations positioned around each of the active work areas. There are currently three air monitoring station groups set up at different areas on-Site. The locations for each Group are presented on Figure 1.1. Group 1 air monitoring stations are located around the perimeter of the Staging Pad Area and North of AOI 4 (NAOI4) (excavation and backfill activities). Group 2 and 3 air-monitoring stations are located along Baileys Branch of Pleasant Run Creek to monitor Parcel 6-12 and Parcel 3-6 (excavation and backfill activities), respectively.

For TSP sampling, at least one of the four air monitoring locations at each work area is established to represent the upwind location. The results of the upwind sample are compared to the downwind sample results to determine the concentration of emissions that may be migrating off Site potentially due to on-Site construction activities.

The current ambient air criteria for a 24-hour sampling period are provided in Table E.3.2 of the AAQMP. The action level for PCBs is based on National Institute for Occupational Safety and Health (NIOSH) level of $1 \mu\text{g}/\text{m}^3$. This is the Permissible Exposure Limit (PEL). An evaluation of work area practice improvement (to reduce emissions) is initiated at a detected concentration of $0.5 \mu\text{g}/\text{m}^3$ PCBs. The action level for TSPs is defined as 67% in excess of the upwind ambient air concentration, based on Indiana Department of Environmental Management, Title 326, Article 6, Rule 4 of the Indiana Administrative Code.

2.0 SUMMARY OF AIR MONITORING RESULTS

2.1 PCB RESULTS

PCB results for the three air monitoring groups are presented on Figures 2.1 through 2.3, respectively. PCB air monitoring results for Group 1 (staging pad and NAOI4) are presented on Figure 2.1. PCB air monitoring results for the Group 2 (Parcel 6-12) and Group 3 (Parcel 3-6) are presented on Figures 2.2 and 2.3, respectively. The PCB result tables for Stations 1 through 11 are presented in Tables 2.1 through 2.11.

PCB results for all three air-monitoring groups are consistently below the Stop Work Action Level of 100% PCB Allowable ($1 \mu\text{g}/\text{m}^3$) with the exception of four samples collected during October 2003 and November 2003 at Station 8A. These exceedences were related to the location of the station downwind of the wastewater treatment plant outfall (Outfall 002), adjacent to the

vacuum truck air exhaust during the active creek excavation activities. The release of PCB emissions from the vacuum truck was determined to be the cause for the exceedences. Station 8A was subsequently relocated away from vacuum truck operation and an air filter placed on the truck. No exceedences of the PCB stop work action levels have been recorded at any of the monitoring locations since that time.

2.2 TSP RESULTS

TSP results for air monitoring Groups 1, 2, and 3 are presented on Figures 2.4 through 2.6 and data tables are presented in Tables 2.12 through 2.14. Unlike the PCB results, TSP results were evaluated against the upwind concentration of each air-monitoring group as presented in Tables 2.12 through 2.14. The Action Level for TSP is 100% Allowable, which is defined as 67% in excess of the upwind ambient air concentration.

As described above, the TSP criteria are evaluated based on the upwind concentration. For example, if the TSP concentration for the upwind station is low for that day, a small increase in TSP concentration in downwind stations will cause an exceedence. Conversely, if the TSP concentration in the upwind station is high, it will likely not cause any exceedence for the downwind stations.

As presented in Figures 2.4 through 2.6, exceedences were observed in all three air monitoring groups on various dates. The majority of exceedences occurred at Group 1 air monitoring stations. Air monitoring Station 1, of Group 1, was located at the northwest corner of the ZIPP Lot. A considerable amount of dust is believed to be generated from truck traffic at the ZIPP lot (which includes not only site trucks, but also trucks that support plant operations), which is the likely cause of these exceedences.

It should be noted that there were three additional exceedences observed on 01/21/04 (Group 3, Station 6), 04/02/04 (Group 1, Station 1), and 04/09/04 (Group 2, Station 9) which are presented in Tables 2.12 through 2.14, respectively. These exceedences are not graphically displayed on Figures 2.4 through 2.6 due to the vertical scale used on the graphs (i.e. the remaining data points would be hard to distinguish). The exceedence at Group 1 was caused by truck traffic at the ZIPP Lot and exceedences at Group 2 and 3 were considered anomalies.

3.0 SUMMARY OF PCB INVESTIGATIVE RESULTS

In October 2001, the Phase 1 stream investigation program identified the presence of PCBs in the Study Area. Based on those findings, a second phase of sampling was conducted to further evaluate PCB concentrations in floodplain soils. Samples were collected from floodplain areas, bank soil, and sediment to delineate the extent of PCB contamination.

The extent of impacted areas in the Upstream and Downstream parcels, based on stream, soil, and sediment sampling results, are presented on Figures 3.1 and 3.2, respectively. Figures 3.1 and 3.2 presents PCB concentration contours in various increments between 1.8 to greater than 50 mg/kg. By analyzing the Upstream and Downstream PCB concentrations, Figure 3.1 identifies significantly higher PCB concentrations for the Upstream Parcels compared to the Downstream Parcels presented on Figure 3.2.

It should also be noted that the Upstream Parcels are the ones that are closest to residences that are currently inhabited and therefore the areas where any exceedences would most likely have a potential for exposure.

Since there have been limited PCB exceedences based on the air monitoring results during the Upstream Parcel Removal Action activities, where the PCB concentrations are generally considerably higher, it can be expected that the PCB concentrations in air will be even lower during the Downstream Parcel Removal Action activities. The areas further down stream will also be more remote and further away from any inhabited residence, thereby further limiting the potential for exposure.

4.0 PROPOSED MODIFICATION TO THE AAQMP

CRA is proposing to reduce air monitoring for PCBs at both the excavation and staging areas during the Parcel 22 and Downstream Parcel Removal Action activities. TSP monitoring would continue to be monitored on a daily basis since exceedences of the action levels have been observed. This proposed modification is based on the validated analytical results obtained from November 2003 to the present, the PCB identified concentrations in soil for Parcel 22 and the Downstream Parcels, and the increased distance away from inhabited residences.

The revised AAQMP will include:

PCB

PCB air monitoring will continue to be conducted one day per week at each active Soil Staging Area to demonstrate that atmospheric PCB levels at these locations remain below the Action Levels. In general, the monitoring will include the designation of one upwind and one downwind location selected by the Air Monitoring Technician for that date. The monitoring locations will be established at the perimeter of the work areas. In addition, PCB air monitoring will be conducted whenever excavation activities are initiated within 750 feet of an occupied residence or within 500 feet of an active road crossing. These locations are identified on Figures 4.1 and 4.2. For each of the locations identified on Figures 4.1 and 4.2, PCB air monitoring results will be assessed with other relevant factors (including factors such as the type of activity,

**CONESTOGA-ROVERS
& ASSOCIATES**

levels of contamination, and position/type of potential receptors) to determine if monitoring should be discontinued for an area. Air monitoring for an area will not be discontinued without U.S. EPA approval. All PCB air monitoring will continue to be routinely reported to U.S. EPA.

TSP

Monitoring will continued as originally specified.
